

AI Agents are software versions of Robots / Humans

Gen AI = Generating Content / Image / Video / Audio

Gen AI + Think = Generate Content after Reasoning

Gen AI + Think + Tools = Generate Content after Reasoning and Execute the tool to complete = AI Agent

AI Agents (software version of humans / robots)

Hiring Agents

1. Career Email Monitor and Shortlister Agent (**Open AI GPT 5.2**)
 - Access email inbox
 - Open emails with the right subject line for the role
 - Read the mail body
 - Open attached Profile
 - Review and Shortlist
2. Interview Scheduler Agent (**Grok v4**)
 - Propose 2-3 interview slots to the candidate
 - Send a mail to candidate and tech manager
3. Interview Confirmation Watcher Agent (**Gemini 3 preview**)
 - Checks email for confirmation
 - If candidate confirms move to next steps
 - Send interview mailer with slot

The future of AI Agents vs. Agentic AI

- 1/ Most AI tools today do one task well. That's an AI Agent.
- 2/ The future is systems that think, plan, and collaborate. That's Agentic AI.
- 3/ AI Agents are doers. Agentic AI are decision-makers.
- 4/ AI Agents follow rules. Agentic AI writes new ones on the fly.
- 5/ One works solo. The other is a team of AIs working together.
- 6/ AI Agents help with email replies. Agentic AI can run your research lab.
- 7/ Agentic AI uses memory, planning, and collaboration to handle chaos.
- 8/ Imagine 10 AIs, each with a role, working as a team. That's Agentic AI.
- 9/ AI Agents are task-focused. Agentic AI is outcome-focused.
- 10/ AI Agents get stuck in loops. Agentic AI adapts and moves on.
- 11/ AI Agents break when context shifts. Agentic AI re-plans.
- 12/ You can't scale AI without memory. Agentic AI solves that.
- 13/ The key is orchestration getting agents to cooperate without chaos.
- 14/ Think supply chains, hospitals, game engines, Agentic AI fits here.
- 15/ Chatbots aren't intelligent systems. That's the trap.
- 16/ Real intelligence comes from coordination, not just generation.
- 17/ Long-term reliability needs memory, reflex, and collaboration.
- 18/ Agentic AI uses feedback loops: act → observe → adjust.
- 19/ AI Agents hallucinate when out of context. Agentic AI learns from mistakes.
- 20/ Managing Agentic AI needs governance, not just prompts.
- 21/ The biggest challenge is coordination without confusion.
- 22/ When your AI team argues with itself, things break.
- 23/ Agentic AI needs transparency, traceability, and strong rules.
- 24/ Tool use isn't enough. The system must choose the right tool.
- 25/ RAG, ReAct, memory layers, these are real building blocks, not buzzwords.
- 26/ Most startups today are still building AI Agents.
- 27/ Don't just build a smart agent. Build a smart system.

Agent Processes

Humans

- Brain
- Roles
- Think
- Memory
- Plan
- Act

AI Agents (software version of humans / robots)

- LLM (Brain)
- System Prompt (Roles)
- Reasoning (Think)
- Memory (Memory for better Context)
- Plan
- Calling Tool (Act)

Types of AI Agents

1. Chat Agents (chatgpt , gemini)
2. Autonomous Agents (when you check whether in chatgpt)
3. Semi-Autonomous Agents / Human-in-the-loop (HITL) Agents
4. Deep Agents / Long-running Agents

Responsible AI

Humanity: “Don’t be evil.”

AI: “Define ‘don’t.’”

The only difference between you and TonyStark is that he had unlimited API tokens
